Supervisedandunsupervisedlearning:

In Supervised Learning, a machine is trained using 'labeled'data. Datasetsare said to be labeled when they contain both input and output parameters.Inotherwords,thedatahasalready beentaggedwiththecorrectanswer.

Common ML Problems

- **Classification**
- **Regression**
- **Clustering**

Unsupervised learning, also known as unsupervised machine learning, uses machine learning algorithms to analyze and cluster unlabeled datasets. These algorithms discover hidden patterns or data groupings without the need for human intervention. Its ability to discover similarities and differences in information makes it the ideal solution for exploratory data analysis, cross-selling strategies, customer segmentation, and image recognition.

Clustering, Classification and Regression:

In the field of machine learning, we all know the type of problems are different; sometimes we predict the value on a previous set of data—where data learn from a available dataset, or sometimes grouping them into some cluster. So today we are going to see what these terms are—Clustering, Classification and Regression means in the data science field. Let's dive into this concept.

Generally machine learning algorithms are categorised on the basis of output type and type of problem that need to be addressed. So these algorithms are divided into three categories–

1. Classification
2. Regression
3. Clustering

Classification:–

Classification is the type of supervised machine learning. For any given input, the classification algorithm helps in the prediction of the class of the output variables. There can be multiple types of classification are– binary classification, multi-class classification.

Types of classification–

- K-Nearest Neighbour
- Logistic regression
- Decision tree
- Random forest
- Naive Bayes
- SVM (Support vector machine)

Regression:–

Regression is the type of supervised machine learning. When the output is continuous like age, height etc. one of the very popular regression algorithm is Linear Regression.

Types of Regression–

- Linear Regression
- Ridge Regression
- Lasso

Clustering:–

Clustering is an unsupervised machine learning algorithm, it is used to group data points having similar characteristics as a cluster.

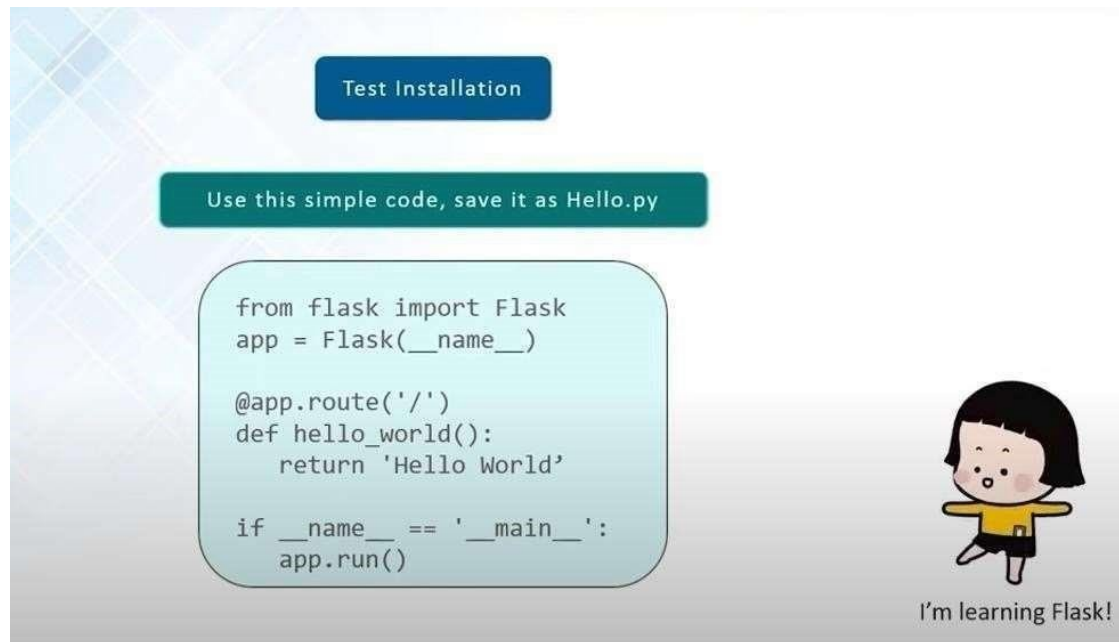

Clustering is divided into two groups

1. Hard clustering– In hard clustering, the data point is assigned to one of the clusters only.
2. Soft clustering– It provides a probability likelihood of a data point to be in each of the clusters.

Python Flask:

FlaskTutorialprovidesthebasicandadvancedconceptsofthePythonFlaskframework.OurFlasktutorialisdesignedforbeginnersandprofessionals.

Flask is a web framework that provides libraries to build lightweight web applications inpython. It is developed by Armin Ronacher who leads an international group of pythonenthusiasts (POCCO).

```
from flask import Flask
app = Flask(__name__)

@app.route('/')
def hello_world():
    return 'Hello World'

if __name__ == '__main__':
    app.run()
```

I'm learning Flask!

What is Flask?

Flask is a web framework that provides libraries to build lightweight web applications inpython. It is developed by Armin Ronacher who leads an international group of pythonenthusiasts(POCCO).ItisbasedonWSGItoolkitandjinja2templateengine. Flaskisconsideredasamicroframework.
